Format and topics for exam 3
Math 127

General information. Exam 3 will be a timed test of 75 minutes, including 10 minutes upload time, covering Sections 7.1–7.6 and 8.1–8.5 of the class notes/text. While not assigned explicitly, you may also find the worked examples of 7.7 to be helpful. More to the point, the exam will cover the portions of PS07–09 coming from Chs. 7–8 and the ideas contained therein. You are allowed

ONE PAGE OF NOTES

and no other aids (books or calculators).

As before, most of the exam will rely on understanding the problem sets and the definitions and theorems that lie behind them. If you can do all of the homework, and you know and understand all of the definitions and the statements of all of the theorems we've studied, you should be in good shape. You should not spend time memorizing proofs of theorems from the book, though understanding those proofs does help you understand the theorems. On the other hand, you should defintely spend time memorizing the *statements* of the important theorems in the text.

Exam 3 will follow the usual ground rules. In particular, no books, notes, or calculators are allowed, and there will be the same four types of questions: computations, statements of definitions and theorems, proofs, explanations/problem solving, and true/false with justification.

Definitions. The most important definitions and symbols we have covered are:

7.1	ideal	principal ideal generated by a
	(a)	ideal generated by a and b
	(a, b)	
7.2	additive coset	$r + I$
	coset representative	quotient ring
	R/I	
7.3	reduced representative	root of $m(x)$
	$F[\alpha]$ where α is a root of $m(x)$	
7.4	PID	minimal polymomial
7.5	homomorphism	isomorphism
	automorphism	
7.6	order (of a ring/field)	characteristic of R
	multiplicative group $F^\times$	cyclic subgroup $\langle\alpha\rangle$
	cyclic	order (of an element)
	$\mathbf{F}_q$	
8.1	Hamming n-code ($n = 2^r - 1$)	
8.2	code of length n over $\mathbf{F}_q$	cyclic code
	polynomial notation	
8.3	generator polynomial of a cyclic code	
8.4	extension field	factoring over a field F
	Frobenius orbit	

Theorems, results, algorithms. The most important theorems, results, and algorithms we have covered are listed below. You should understand all of these results, and you should be able to state any theorem clearly and correctly. More precisely, you should be able to state any of the theorems, given a reasonable identification of the theorem (either its name or a vague description).

Sect. 7.1 Ideals are closed under negatives (Thm. 7.1.9).

Sect. 7.2 "Same coset" descriptions (Thm. 7.2.4). R/I is a ring.

Sect. 7.3 Reduced representatives in $F[x]/I$ (Thm. 7.3.2); units in $F[\alpha]$ (Cor. 7.3.7); when is $F[x]/(m(x))$ a field (Cor. 7.3.8).

Sect. 7.4 Euclidean domains are PIDs (Thm. 7.4.2), computing minimal polynomial of $(a(x), b(x))$ (Thm. 7.4.5). PIDs have unique factorization (Thm. 7.4.6).

Sect. 7.5 Homomorphisms preserve 0, negatives (Thm. 7.5.4). Composition of homomorphisms is a homomorphism (Thm. 7.5.5); inverse of an isomorphism is a homomorphism (Thm. 7.5.7). Automorphisms and zeros (Thm. 7.5.11); complex roots of a real polynomial come in conjugate pairs (Cor. 7.5.12).

Sect. 7.6 Finite field facts: prime characteristic (Thm. 7.6.5); multiplicative group $F^\times$ cyclic; every $\alpha \in \mathbf{F}_q$ is a root of $x^q - x$; constructed by $\mathbf{F}_p[x]/m(x)$; there exists a unique field $\mathbf{F}_q$ of order q. Also: Facts about orders (Thm. 7.6.11).

Sect. 7.7 Worked examples of finite fields: $\mathbf{F}_8$ and $\mathbf{F}_{16}$.

Sect. 8.2 Cyclic codes are ideals (Thm. 8.2.6).

Sect. 8.3 Cyclic codes are principal ideals $g(x)$, where $g(x)$ divides $x^n - 1$. Basis and dimension for cyclic code $(g(x))$.

Sect. 8.4 Frobenius map is an automorphism (Thm. 8.4.7). Minimal polynomial for $\beta \in E$ (Thm. 8.4.8). Orbit Theorem 8.4.11.

Sect. 8.5 BCH Theorem 8.5.1. BCH Algorithm 8.5.2.

Examples. You will also need to be familiar with the key properties of the main examples we have discussed. The most important examples we have seen are:

Sect. 7.1 Examples of ideals: Even integers, R, $\{0\}$, (m), $(m(x))$, substitution kernel.

Sect. 7.2 Cosets of (2), (5). $\mathbf{Z}/(2)$ (Exmp. 7.2.10).

Sect. 7.3 Computation in $\mathbf{F}_2[x]/(x^4 + x + 1)$. Inversion in $\mathbf{F}_2[x]/m(x)$.

Sect. 7.5 Canonical homomorphism $\varphi : R \to R/I$, substitution homomorphism. Complex conjugation, induced homomophrism.

Sect. 7.6 Characteristics of $\mathbf{Z}/(m)$, $\mathbf{F}_q[x]/(m(x))$. Primitive elements and orders of other elements in $\mathbf{Z}/7$ (Exmp. 7.6.12).

Sect. 8.1 Problem 8.1.1: burst error picture.

Sect. 8.3 Cyclic codes: parity check, repetition, and $\mathcal{H}_7$.

Sect. 8.4 Minimal polynomial for $\alpha \in \mathbf{F}_q$. Factoring over different fields F (Exmp. 8.4.3, 8.4.4). Orbits in $\mathbf{F}_8$.

Sect. 8.5 BCH examples (Exmp. 8.5.3, 8.5.4, 8.5.5).

Other. You should have a working familiarity with techniques and strategies for proof and logic tips, to the extent that we have done proofs in the homework. In particular, you should review how to prove that a set is closed under a given operation, and how to prove that a subset I of a ring R is an ideal.

Not on exam. Kernels (7.5.13–7.5.15).

Good luck.
